# TOWERANCHOR

TOWERANCHOR offers a way of using fall protection without climbing up a tower to mount the fall protection rope. This is possible by using a stationary towrope to pull the fall protection rope up and through TOWERANCHOR is mounted on the top beam of the tower. When the fall protection rope is pulled up, through and down to the ground level, both the ends of the fall protection rope is attached to the base of the tower. After the fall protection rope is secured the user connect the rope grab to the fall protection rope and to the harness. Now we have a complete fall protection system and the user can start to climb safe and conduct the work.

## Advantages:

- Due to the fact that the user always use a fall protection rope together with TOWERANCHOR, the user can make sure that the equipment is checked and inspected before the start of the work.
- TOWERANCHOR is not a fall protection device which means that there is no demand for yearly inspection.
- When working in wooden poles there is no risk for a back-word fall.
- Power Ascenders can be used.
- Low cost
